Descriptions

DIO4480 is a high performance USB Type-C analog switch used in portable multimedia devices, which supports analog audio headsets. DIO4480 can detect OMTP, CTIA or 3-Pole headset and configure pinout automatically. DIO4480 shares common Type-C pins to pass USB2.0 signal and analog audio signal, sideband use wires and analog microphone signal. DIO4480 also supports high voltage and surge on SBUx pins and USB pins on USB Type-C receptacle side.

I²C SPECIFICATION

t_{BUF}	Bus-Free Time between STOP and START Conditions	1.3			μs
t_{SP}	Pulse Width of Spikes that Must Be Suppressed by the Input Filter	0		50	ns

Note: 2. Guaranteed by characterization. Not production tested.

3. A fast-mode I²C-bus device can be used in a standard-mode I²C-bus system, but the requirement $t_{SU; DAT} \geq \pm 250ns$ must be met. This is automatically the case if the device does not stretch the LOW period of the I²C_SCL signal. If such a device does stretch the LOW period of the I²C_SCL signal, it must output the next data bit to the I²C_SDA line $t_{r_{max}} + t_{SU; DAT} = 1000 + 250 = 1250ns$ (according to the standard-mode I²C bus specification) before the I²C_SCL line is released.

Application Information

Over-Voltage Protection

DIO4480 features over-voltage protection (OVP) on receptacle side pins that turns off the internal signal routing path if the voltage exceeds the OVP threshold. If OVP is occurred, pin INT will be pulled down, which is an open-drain output pin. Flag register 0x02h and 0x03h will indicate which pin had OVP event.

Headset Detection

DIO4480 integrates headset unplug detection function by detecting the CC_IN voltage. The function will be active when device is enabling. Output pin DET will be high when CC_IN is low ($CC_IN < 1.2V$), and DET will be low when $CC_IN = High$ ($CC_IN > 1.5V$).

	Device Disable	Device Enable
$CC_IN < 1.2V$	DET = 0	DET = 1
$CC_IN > 1.5V$	DET = 0	DET = 0

MIC Switch Auto-off Function

The function is active during control bit 0x12h bit [2] = 1. When CC_IN is changed from low to high, and L, R, AGND switches are under on status, MIC switch will be off and receptacle side pin will be pulled to ground for 50μs first. Then it shows high-Z status under MIC switch is set on status.

Audio Jack Detection and Configuration

The function is active when control bit 0x12h bit [0] = 1. When the headset is inserted, DIO4480 can detect OMTP, CTIA or 3-Pole headset and configure pinout automatically. During detection and configuration, the R, L, Sense, MIC and Audio ground switch will be off. After detection and configuration, R, L, MIC, Sense and AGND switches will turn on according to detection results and timing control setting.

Manual Switch Control

The function is active during control bit 0x12h bit [4] = 1 and 0x04h = FF. It will provide manual control for device. During this configuration, ADDR and INT pins will be set as logic control input.

I²C Interface

The DIO4480 includes a full I²C slave controller. The I²C slave fully complies with the I²C specification version 2.1 requirements. This block is designed for fast mode, 400kHz, signals. Examples of an I²C write and read sequence are shown in below figures respectively.

NOTE: Single Byte read is initiated by Master with P immediately following first data byte.

Figure 4. I²C Write Example

NOTE: If Register is not specified Master will begin read from current register. In this case only sequence showing in Red bracket is needed
