

DIO59111A/B/C/D

USB-Compliant Single-cell Li-Ion 1.5A Switching Charger

Features

- Fully Integrated, High-Efficiency Charger for Single-Cell Li-Ion and Li-Polymer Battery Packs
- Faster Charging than Linear
- Charge Voltage Accuracy: $\pm 0.5\%$ (A:4.2V,B:4.3V,C:4.35V,D:4.4V)
- $\pm 7\%$ Input Current Regulation Accuracy
- $\pm 7\%$ Charge Current Regulation Accuracy
- 26V Absolute Maximum Input Voltage
- 6V Maximum Input Operating Voltage
- 1.5A Maximum Charge Rate
- 2MHz Synchronous Buck PWM Controller with Wide Duty Cycle Range
- Small Footprint 1 μ H External Inductor
- Dynamic Input Voltage Control
- Low Reverse Leakage to Prevent Battery Drain to VBUS
- Available in DFN3*3-12 Package

Descriptions

The DIO59111 combines a highly integrated switch-mode charger, to minimize single-cell Lithium-ion (Li-ion) charging time from a USB power source.

The charger regulator circuits switch at 2MHz to minimize the size of external passive components.

The DIO59111 provides battery charging in three phases: conditioning, constant current and constant voltage.

To ensure USB compliance, the input current limit can be changed.

The integrated circuit (IC) automatically restarts the charge cycle when the battery falls below an internal threshold. If the input source is removed, the IC enters a high-impedance mode, preventing leakage from the battery to the input. Charge current is reduced when the die temperature reaches at 120°C, protecting the device and PCB from damage.

Applications

- Cell Phones, Smart Phones, PDAs
- Tablet, Portable Media Players
- Gaming Device, Digital Cameras

Ordering Information

Order Part Number	Top Marking		T _A	Package	
DIO59111XCD12	59111X	Green	-40 to 85°C	DFN3*3-12	Tape & Reel, 5000

Pin Assignments

Figure 1. Pin Assignment (Top View)

Pin Definitions

Name	Description
NC	No connection.
NTC	Monitor battery temperature input connected to the battery NTC resistor.
DISABLE	Charging enable input, charging start when disable is low.
CTRL	CTRL=0, input current limit is 500mA. CTRL=1, input current is no limit.
STAT	Status. Open-drain output indicating charge status. The IC pulls this pin LOW when charging, and pulses STAT pin when fault.
BAT	Battery Voltage. Connect to the positive (+) terminal of the battery pack. Bypass with a 0.1µF capacitor to GND if the battery is connected through long leads.
CSIN	Charging current detection input terminal.
VBUS	Charger Input Voltage. Bypass with a 1µF capacitor to PGND.
PMID	Power Input Voltage. Power input to the charger regulator, bypass point for the input current sense, and high-voltage input switch. Bypass with a minimum of 10µF, 6.3V capacitor to PGND.
SW	Switching Node. Connect to output inductor.
GND	Ground.
Thermal Pad	Exposed pad beneath the IC for heat dissipation. Always solder thermal pad to the board, and have via on the thermal pad plane star-connecting to GND.

Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Rating” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Parameter		Rating	Unit
VBUS Voltage	Continuous	-1.4 to 26.0	V
	Pulsed, 100ms Maximum Non-Repetitive	-2.0 to 26.0	
STAT Voltage		-0.3 to 26.0	V
PMID Voltage		6.5	V
SW, CSIN, VBAT, DISABLE Voltage		-0.3 to 6.5	
Voltage on Other Pins		-0.3 to 6.5	V
Maximum V _{BUS} Slope above 5.5V when Charger are Active		4	V/μs
ESD	HBM	2000	V
	CDM	500	
Junction Temperature		-40 to 150	°C
Storage Temperature		-65 to 150	°C
Lead Soldering Temperature, 10 Seconds		260	°C

Recommend Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended Operating conditions are specified to ensure optimal performance to the datasheet specifications. DIOO does not Recommend exceeding them or designing to Absolute Maximum Ratings.

Parameter		Rating	Unit
Supply Voltage		4 to 6	V
Negative VBUS Slew Rate during VBUS Short Circuit, C _{MID} ≤ 4.7μF	T _A ≤ 60°C	4	V/μs
	T _A ≥ 60°C	2	
Ambient Temperature		-30 to 85	°C
Junction Temperature		-30 to 120	°C

Typical Application

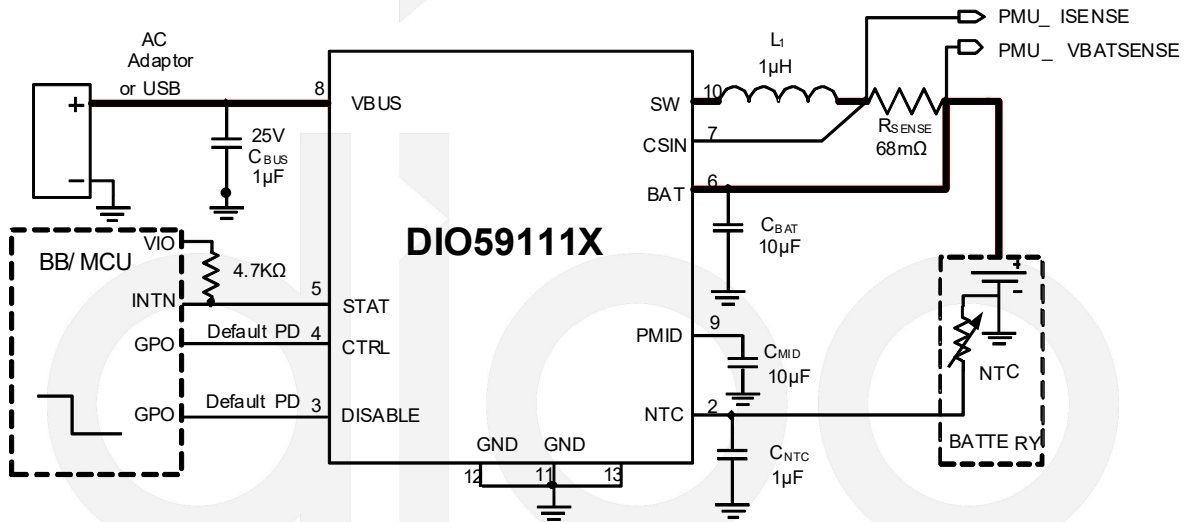

Figure 3. Typical Application

Application Information

Circuit Description/Overview

When charging batteries with a current-limited input source, such as USB, a switching charger's high efficiency over a wide range of output voltages minimizes charging time.

DIO59111 combines a highly integrated synchronous buck regulator for charging. The regulator employs synchronous rectification for charger regulators to maintain high efficiency over a wide range of battery voltages and charge states.

The DIO59111 has three operating modes:

1. Charge Mode:
Charge a single-cell Li-ion or Li-polymer battery.
2. High-Impedance Mode:
The charging circuits are OFF in this mode. Current flow from VBUS to the battery or from the battery to VBUS is blocked in this mode. This mode consumes very little current from VBUS or the battery.

Charge Mode

In charge Mode, DIO59111 employs four regulation loops:

1. Input Current: Limits the amount of current drawn from VBUS. This current is sensed internally and can be set by CTRL pin.
2. Charging Current: Limits the maximum charging current. This current is sensed using an external R_{SENSE} resistor.
3. Charge Voltage: The regulator is restricted from exceeding this voltage. As the internal battery voltage rises, the battery's internal impedance and R_{SENSE} work in conjunction with the charge voltage regulation to decrease the amount of current flowing to the battery. Battery charging is completed when the voltage across R_{SENSE} drops below the I_{TERM} threshold.
4. Temperature: If the IC's junction temperature reaches 120°C , charge current is reduced until the IC's temperature stabilizes at 120°C .
5. An additional loop limits the amount of drop on VBUS to a voltage (V_{SP}) to accommodate "special chargers" that limit current to a lower current than might be available from a "normal" USB wall charger.

Battery Charging Curve

If the battery voltage is below V_{SHORT} , a linear current source pre-charges the battery until V_{BAT} reaches V_{SHORT} . The PWM charging circuit is then started and the battery is charged with a constant current if sufficient input power is available. The current slew rate is limited to prevent overshoot.

The DIO59111 is designed to work with a current-limited input source at VBUS. During the current regulation phase of charging, I_{NLIM} limits the current available to charge the battery and power the system. The effect of I_{NLIM} on I_{CHARGE} can be seen in Figure 5.

Figure 4. Charge Curve, I_{CHARGE} Not Limited by I_{INLIM}

Figure 5. Charge Curve, I_{INLIM} Limits I_{CHARGE}

Assuming that V_{OREG} is programmed to the cell's fully charged "float" voltage, the current that the battery accepts with the PWM regulator limiting its output (sensed at V_{BAT}) to V_{OREG} declines, and the charger enters the voltage regulation phase of charging. When the current declines to I_{TERM} value, the charge cycle is complete.

A new charge cycle begins when one of the following occurs:

- The battery voltage falls below $V_{OREG} - V_{RCH}$
- V_{BUS} Power on Reset (POR) clears and the battery voltage is below the V_{SHORT} .
- Reset DISABLE pin .

PWM Controller in Charge Mode

The IC uses a current-mode PWM controller to regulator the output voltage and battery charge currents. The synchronous rectifier (Q2) has a current limit that which off the FET when the current is negative by more than 400mA peak. This prevents current flow from battery.

V_{BUS} POR/Non-Compliant Charger Rejection

When the IC detects that V_{BUS} has risen above $V_{IN(MIN)}$ (4.3V), the IC applies a 250Ω load from V_{BUS} to GND. To clear the V_{BUS} POR (Power-On-Reset) and begin charging, V_{BUS} must remain above $V_{IN(MIN)}$ and below $V_{BUSOVVP}$ for t_{VBUS_VALID} (30ms) before the IC initiates Charging. The V_{BUS} validation sequence always occurs

charging is initiated or re-initiated (for example, after a VBUS OVP fault or a V_{RCH} recharge initiation).
 t_{VBUS_VALID} ensures that unfiltered 50/60Hz chargers and other non-compliant chargers are rejected.

Special Charger

The DIO59111 has additional functionality to limit input current in case a current-limited “special charger” is supplying VBUS. These slowly increase the charging current until either.

- I_{NLIM} or $I_{OCHARGE}$ is reached
- or
- $V_{BUS}=V_{SP}$.

If V_{BUS} collapses to V_{SP} when the current is ramping up, the DIO59111 charge with an input current that keeps $V_{BUS}=V_{SP}$.

Thermal Regulation and Protection

When the IC’s junction temperature reaches T_{CF} (about 120°C), the charger reduces its output current to 550mA to prevent overheating. If the temperature increases beyond $T_{SHUTDOWN}$; charging is suspended, and STAT is pulsed HIGH. In Suspend Mode, all timers stop and the state of the IC’s logic is preserved. Charging resumes after the die cools to about 120°C.

Additional θ_{JA} data points, measured using the DIO59111 evaluation board, are given in Table 8 (measured with $T_A=25^\circ\text{C}$). Note that as power dissipation increases, the effective θ_{JA} decreases due to the larger difference between the die temperature and ambient.

Table 1. Evaluation Board Measured θ_{JA}

Power (W)	θ_{JA}
0.504	54°C/W
0.844	50°C/W
1.506	46°C/W

Charge Mode Input Supply Protection

Sleep Mode

When V_{BUS} falls below $V_{BAT}+V_{SLP}$, and V_{BUS} is above $V_{IN(MIN)}$. the IC enters Sleep Mode to prevent the battery from draining into VBUS. During Sleep Mode, reverse current is disabled by body switching Q1.

Input Supply Low-Voltage Detection

The IC continuously monitors VBUS during charging. If V_{BUS} falls below $V_{IN(MIN)}$, the IC:

1. Terminates charging.
2. Pulses the STAT pin, sets the STAT bits to 11, and sets the FAULT bits to 011.

If V_{BUS} recovers above the $V_{IN(MIN)}$ rising threshold after time 30ms, the charging process is repeated. This function prevents the USB power bus from collapsing or oscillating when the IC is connected to a suspended USB port.

Input Over-Voltage Detection

When the V_{BUS} exceeds $V_{BUS_{OVP}}$, the IC:

1. Turns off Q3
2. Suspends charging
3. Pulses the STAT pin.

When V_{BUS} falls about 150mV below $V_{BUS_{OVP}}$, the fault is cleared and charging resumes after V_{BUS} is revalidated (see VBUS POR/Non-Compliant Charger Rejection).

Charge Mode Battery Detection & Protection

VBAT Over-Voltage Protection

The OREG voltage regulation loop prevents V_{BAT} from overshooting the OREG voltage when the battery is removed. When the PWM charger runs a voltage higher than 4.8V, PWM pulses stop and pulses the STAT pin.

Battery Detection During Charging

The IC can detect the presence, absence, or removal of a battery. During normal charging, once V_{BAT} is close to V_{OREG} and the termination charge current is detected, the IC terminates charging and turns on a discharge current, I_{DETECT} , for 30ms. If V_{BAT} is still above 2V, the battery is present. If V_{BAT} is below 2V, the battery is absent and IC enter No Battery Mode.

Battery Short-Circuit Protection

If the battery voltage is below the short-circuit threshold (V_{SHORT}); a linear current source, I_{SHORT} , supplies V_{BAT} until $V_{BAT} > V_{SHORT}$.

NTC protection

NTC pin output 30uA current to NTC resistor (10k Ω). When battery temperature rises to 50°C ($V_{NTC}=120mV$) or falls to 0°C ($V_{NTC}=0.9V$), the IC stops charging, and IC pulses the STAT pin. If NTC protection is not used, NTC pin must connect to 10k Ω normal resistor to ground.

System Operation with No Battery

The DIO59111 continues charging after V_{BUS} POR with the default parameters, regulating the V_{BAT} line to 3.78V. In this way, the DIO59111 can start the system without a battery. Re-connect power to V_{BUS} or reset DISABLE pin, IC can exit No Battery Mode.

Charger Status/Fault Status

The STAT pin indicates the operating condition of the IC and provides a fault indicator for interrupt driven systems.

Table 2. STAT Pin Function

EN_STAT	Charge State	STAT Pin
X	No Charging	OPEN
1	Charging	LOW
x	Fault	2Hz Pulse

The type of fault in Charge Mode (see Table 3).

Table 3. Fault Status Bits During Charge Mode

Fault Description

NTC protection

PCB Layout Recommendations

Bypass capacitors should be placed as close to the IC as possible. In particular, the total loop length for CMID should be minimized to reduce overshoot and ringing on the SW, PMID, and VBUS pins. All power and ground pins must be routed to their bypass capacitors, using top copper whenever possible. Copper area connecting to the IC should be maximized to improve thermal performance if possible.

CONTACT US

Dioo is a professional design and sales corporation for high-quality and performance analog semiconductors. The company focuses on industry markets, such as, cell phone, handheld products, laptop, and medical equipment and so on. Dioo's product families include analog signal processing and amplifying, LED drivers and charger IC. Go to <http://www.dioo.com> for a complete list of Dioo product families.

For additional product information, or full datasheet, please contact with our Sales Department or Representatives.

A large, light gray watermark of the Dioo logo is centered on the page, consisting of a stylized arrow and the word "dioo" in lowercase.
